☐ Experimental Results

☐ Conclusion & Future Work

ICIP, Oct. 27-30, 2014, Paris, France

Introduction

- In a raw depth video capturing a natural scene
  - Various complex and even unpredictable dynamic contents
  - As well as spatial and temporal artifacts

- Artifacts in the depth video
  - Both in Spatial and temporal domain
  - Errors are caused by
    - Low resolution
    - Noise & outliers
    - Occlusions, material absorption & reflection
    - Distortion around object boundaries, and etc.

Raw Kinect video
Color-coded Raw TOF video

ICIP, Oct. 27-30, 2014, Paris, France

Introduction

- After the spatial enhancement
  - Reduce artifacts in spatial domain
  - But not enough to deal with *temporal flickering*
    - No temporal consistency
    - Aggravate flickering artifacts

Raw Kinect video

Spatial JBF [1]

[1] J. Kopf et al, *Joint bilateral upsampling*, in ACM ToG., 2007.

Introduction

- After the spatial enhancement
  - Reduce artifacts in spatial domain
  - But not enough to deal with *temporal flickering*
    - No temporal consistency
    - Aggravate flickering artifacts
- After a conventional spatiotemporal enhancement
  - Still contain temporal flickering
  - Distort the necessary depth variation along dynamic objects
- How to eliminate the temporal flickering while do not distort the necessary depth variation along the dynamic objects?

ICIP, Oct. 27-30, 2014, Paris, France

A static object

Captured depth map
A moving object

V

The static background

Intrinsic Static Structure

- Definition
  - A manifold lies on or behind the input depth map
 - Contains static structure of the captured scene

Kinect or another
depth camera

A static object

Intrinsic static structure

A moving object

v

The static background

Intrinsic Static Structure

Observation

- Moving objects stay in its front
- Static regions or visible background area are fused into it

Intrinsic Static Structure

- How to estimate the intrinsic static structure under an on-line fashion?

- Temporal enhancement of the depth video?

- A probabilistic generative model

- An online variational probabilistic update scheme with
  - A robust exclusion of the dynamic foreground objects
  - the inclusion of the once occluded background

- Robust static region detection by the intrinsic static structure

- Enhance the static region of input depth frame
  - Dynamic objects own limited temporal consistency, we just omit it
  - Fusing the static region with the estimated intrinsic static structure

ICIP, Oct. 27-30, 2014, Paris, France

Intrinsic Static Structure

□ **A Probabilistic Generative Model**

If incoming depth d_x^t belongs to

 ▪ **State-I**: the intrinsic static structure

$$\mathcal{N}(d_x^t | Z_x, \tau_x^{-1})$$

  ▪ **State-II**: outliers in the front or moving objects

$$\mathcal{U}_f(d_x^t | Z_x) = U_f \left[d_x^t < Z_x \right)]$$

  ▪ **State-III**: outliers rearward or revealed background

$$\mathcal{U}_b(d_x^t | Z_x) = U_b \left[d_x^t > Z_x \right]$$

d_x^t

ICIP, Oct. 27-30, 2014, Paris, France

Intrinsic Static Structure

- A Probabilistic Generative Model
  - The posterior

$$p(Z_{\mathsf{x}}, \boldsymbol{\omega}_{\mathsf{x}} | \mathcal{D}_{\mathsf{x}}^t) = \frac{p(d_{\mathsf{x}}^t | Z_{\mathsf{x}}, \boldsymbol{\omega}_{\mathsf{x}}) p(Z_{\mathsf{x}}, \boldsymbol{\omega}_{\mathsf{x}} | \mathcal{D}_{\mathsf{x}}^{t-1})}{p(d_{\mathsf{x}}^t | \mathcal{D}_{\mathsf{x}}^{t-1})}$$

$\mathcal{D}_{\mathsf{x}}^{t-1}$ is the set of previous depth samples
$\mathcal{D}_{\mathsf{x}}^t = \{\mathcal{D}_{\mathsf{x}}^{t-1}, d_{\mathsf{x}}^t\}$ is the set of current samples

ICIP, Oct. 27-30, 2014, Paris, France
On-line Update Scheme

- A Probabilistic Generative Model
  - The posterior

$$p(Z_x, \boldsymbol{\omega}_x | \mathcal{D}_x^t) = \frac{p(d_x^t | Z_x, \boldsymbol{\omega}_x) p(Z_x, \boldsymbol{\omega}_x | \mathcal{D}_x^{t-1})}{p(d_x^t | \mathcal{D}_x^{t-1})}$$

$\mathcal{D}_x^{t-1}$ is the set of previous depth samples
$\mathcal{D}_x^t = \{\mathcal{D}_x^{t-1}, d_x^t\}$ is the set of current samples
If the input frame only contains the static scene and outliers, the updated intrinsic static structure will be governed by the posterior, and we have

- The reliability of the model is $\mathbb{E}_{p(\boldsymbol{\omega}_x | \mathcal{D}_x^t)}\left[\omega_x^1\right]$
- Its probable depth is $\mathbb{E}_{p(Z_x | \mathcal{D}_x^t)}\left[Z_x\right]$
- Variational approximation for efficiency

d_x^t

Updated intrinsic static structure

$\mathcal{T}_x^{-1/2}$

Z_x

$$\mathcal{P}_x^t = \{\mu_x^t, \lambda_x^t, \boldsymbol{\alpha}_x^t\}$$

Camera center

ICIP, Oct. 27-30, 2014, Paris, France
On-line Update Scheme

(a) $Z_{\mathbf{x}}^t$ v.s. $\mathcal{D}_{\mathbf{x}}^t$
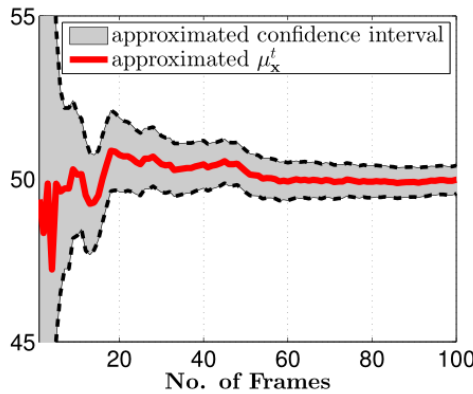

(b) Confidence interval w.r.t. $Z_{\mathbf{x}}^t$
(c) Evolution of each states' portions
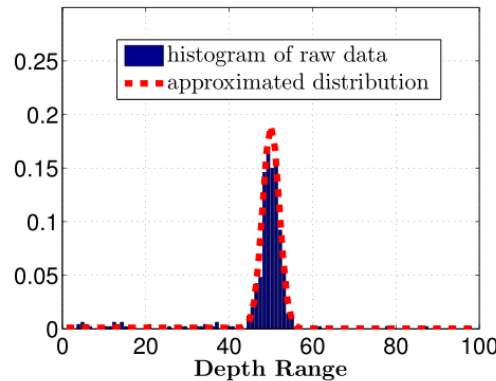

(d) $q^T(d_{\mathbf{x}}|\mathcal{P}_{\mathbf{x}}^{\mathcal{D},T})$ v.s. data histogram

- Variational approximation for a 1D depth signal

a) the probable depth values of the intrinsic static structure versus the raw depth signals

b) The confidence interval of the intrinsic static structure

c) The portions of three states

d) The approximated date distribution $q^T(d_{\mathbf{x}}|\mathcal{P}_{\mathbf{x}}^T)$ versus the histogram of the raw data

The nature of the input data samples is still well captured by the variational approximation

ICIP, Oct. 27-30, 2014, Paris, France

On-line Update Scheme

If the input frame contains the dynamic content, the posterior w.r.t. each state indicates the criterion to update the intrinsic static structure

State-I: fuse the new samples into the current model
State-II: leave the current model unchanged
State-III: have a risk that current model is incorrect, might require re-initialization

- Results after variational approximation are valid for **State-I** and **State-II**

- Only need *an additional criterion* for **State-III**

d_x^t

State-I

Updated intrinsic static structure

$\tau_x^{-1/2}$

Z_x

State-II

State-III

Camera center
On-line Update Scheme

- ☐ **Re-initialization to avoid incorrect estimation when**

  - ☐ Ratio $\rho_x = \alpha_{3,x}^t / \alpha_{1,x}^t > T_\rho$

    It means the percentage of **State-III** is too large to provide enough confidence that current estimation is true

  - ☐ Increment $\Delta_F \alpha_{3,x} = \alpha_{3,x}^t - \alpha_{3,x}^{t-F} > T_F$

    It means there are a successive frames that the states of input depth samples are **State-III**

  - ◼ Or texture consistency is violated at the locations of **State-III**

    If RGB-D video is applicable. One step further, we can exploit the conditional random field to robustly find the re-initialized region

ICIP, Oct. 27-30, 2014, Paris, France
On-line Update Scheme

Algorithm 1: Intrinsic Static Structure Update Scheme

input : Input depth sequence $\{d_x^t | t = 1, 2, \ldots, N\}$;
   Initial parameter set $\mathcal{P}_{init} = \{\mu_x^0, \lambda_x^0, \boldsymbol{\alpha}_x^0\}$;
output: Current parameter set $\mathcal{P}_x^t = \{\mu_x^t, \lambda_x^t, \boldsymbol{\alpha}_x^t\}$;

1 $\mu_x^0 \leftarrow d_x^1$, $\mathcal{P}_x^1 \leftarrow \mathcal{P}_{init}$;   ➤ Parameter initialization
2 for $t \leftarrow 2$ to N do
3 | if $d_x^t > 0$ then   ➤ When input depth sample is valid
4 | | estimate parameter set $\mathcal{P}_x^t$ based on $\mathcal{P}_x^{t-1}$ by variational approximaion;
5 | | $\rho_x \leftarrow \alpha_{3,x}^t / \alpha_{1,x}^t$, $\Delta_F \alpha_{3,x} \leftarrow \alpha_{3,x}^t - \alpha_{3,x}^{t-F}$;
6 | | if $\rho_x > T_\rho$ or $\Delta_F \alpha_{3,x} > T_F$ then   ➤ No texture information is applicable
7 | | | $\mu_x^0 \leftarrow d_x^t$, $\mathcal{P}_x^t \leftarrow \mathcal{P}_{init}$;

8 | else   ➤ When input depth sample is valid, just copy the previous model
9 | | $\mathcal{P}_x^t \leftarrow \mathcal{P}_x^{t-1}$

ICIP, Oct. 27-30, 2014, Paris, France

Temporal Depth Video Enhancement

- Blend **input depth frame/spatially enhanced depth frame** with the estimated **intrinsic static structure**

  - The intrinsic static structure $d_{iss,x}^t = \mu_x^t$

  - The posterior of **state-I**

  $$\gamma_{iss}(d_x^t) = \alpha_{1,x}^{t-1} \mathcal{N}(d_x^t | \mu_x^{t-1}, \tilde{\tau}_x^{t-1})^{-1}) / q^t(d_x^t)$$

  - The temporally enhanced depth value

  $$d_{S,x}^t = (1 - \gamma_{iss}(d_x^t))d_x^t + \gamma_{iss}(d_x^t)d_{iss,x}^t$$

For RGB-D video, Both depth and texture information are helpful to fill depth holes

- Inference the chance that the hole region belongs to the intrinsic static structure

# Experimental Results

☐ Temporal enhancement on dynamic scenes
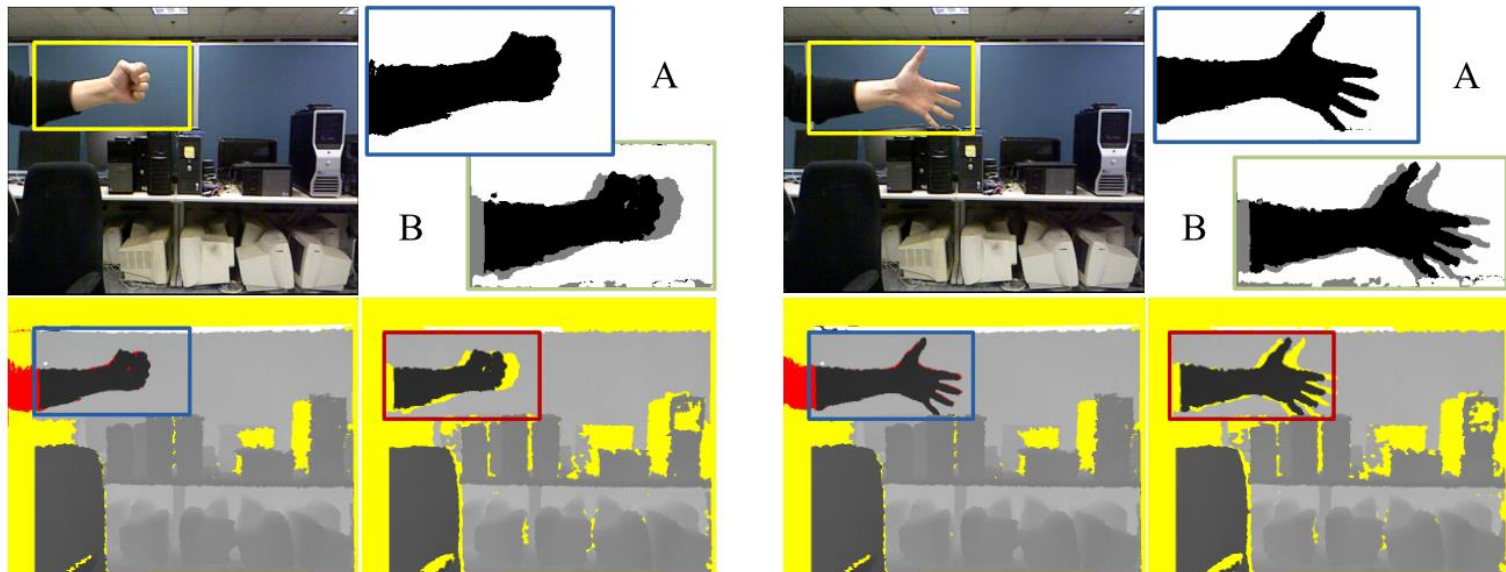

- ◼ Effectively and accurately find the moving objects according to the **state classification**, with the help of conditional random field and the registered color frame
- ◼ Enhance the foreground region by Joint bilateral filter individually, fill in the holes in the static region by the estimated intrinsic static structure

- ◼ Suppress noise and flickering artifacts at static regions

ICIP, Oct. 27-30, 2014, Paris, France

Experimental Results

☐ Temporal enhancement on dynamic scenes

RGB Image   Ours   *TC*-Enhance   *t*-MedFilter

- ■ Effectively and accurately find the moving objects according to the **state classification**, with the help of conditional random field and the registered color frame
- ■ Less motion delay will occur

ICIP, Oct. 27-30, 2014, Paris, France
Experimental Results

Spatiotemporal depth video enhancement

(c) Coherent spatiotemporal JBF   **(d)** Spatiotemporal WMF   **(e)** Ours

ICIP, Oct. 27-30, 2014, Paris, France
Conclusion & Future Work

- Temporal flickering problem of conventional depth enhancement approaches

- Introduction of the intrinsic static structures and its application to temporal enhancement of a depth video

- Discuss the its potential to handle the static and dynamic scenes

- Proper way to further combine spatial and temporal enhancement based on the intrinsic static structure into a whole framework

- Research on a more general formulation of the static structure

- How to deal with depth video captured by moving cameras, and etc.

Thank you!

Any Questions?

ICIP, Oct. 27-30, 2014, Paris, France

On-line Update Scheme

- Variational Parameter Estimation $\mathcal{P}_x^t = \{\mu_x^t, \lambda_x^t, \boldsymbol{\alpha}_x^t\}$
  - Factorize the posterior into independent Gaussian and Dirichlet distributions

  $$q^t(Z_x, \boldsymbol{\omega}_x) = q^t(Z_x)q^t(\boldsymbol{\omega}_x) \sim p(Z_x, \boldsymbol{\omega}_x|\mathcal{D}_x^t)$$

  $$q^t(Z_x) = \mathcal{N}(Z_x|\mu_x^t, (\lambda_x^t)^{-1})$$
  $$q^t(\boldsymbol{\omega}_x) = \mathrm{Dir}(\boldsymbol{\omega}_x|\alpha_{1,x}^t, \alpha_{2,x}^t, \alpha_{3,x}^t)$$

    - The reliability of the model $\mathbb{E}_{p(\boldsymbol{\omega}_x|\mathcal{D}_x^t)}[\boldsymbol{\omega}_x] \approx \mathbb{E}_{q^t(\boldsymbol{\omega}_x)}[\boldsymbol{\omega}_x]$
    - The probable depth is $\mathbb{E}_{p(\boldsymbol{\omega}_x|\mathcal{D}_x^t)}[\boldsymbol{\omega}_x] \approx \mu_x^t$

  - The posterior can be approximated by

  $$q^t(Z_x, \boldsymbol{\omega}_x) \sim \frac{p(d_x^t|Z_x, \boldsymbol{\omega}_x)q^{t-1}(Z_x, \boldsymbol{\omega}_x)}{q^t(d_x^t)} = Q(Z_x, \boldsymbol{\omega}_x|d_x^t)$$

Recursive estimation is possible!

ICIP, Oct. 27-30, 2014, Paris, France

On-line Update Scheme

□ Variational Parameter Estimation $\mathcal{P}_x^t = \{\mu_x^t, \lambda_x^t, \boldsymbol{\alpha}_x^t\}$

- ▪ Factorize the posterior into independent Gaussian and Dirichlet distributions

$$q^t(Z_x, \boldsymbol{\omega}_x) = q^t(Z_x) q^t(\boldsymbol{\omega}_x) \sim p(Z_x, \boldsymbol{\omega}_x | \mathcal{D}_x^t)$$

$$q^t(Z_x) = \mathcal{N}(Z_x | \mu_x^t, (\lambda_x^t)^{-1})$$

$$q^t(\boldsymbol{\omega}_x) = \text{Dir}(\boldsymbol{\omega}_x | \alpha_{1,x}^t, \alpha_{2,x}^t, \alpha_{3,x}^t)$$

- ▪ The posterior can be approximated by

$$q^t(Z_x, \boldsymbol{\omega}_x) \sim \frac{p(d_x^t | Z_x, \boldsymbol{\omega}_x) q^{t-1}(Z_x, \boldsymbol{\omega}_x)}{q^t(d_x^t)} = Q(Z_x, \boldsymbol{\omega}_x | d_x^t)$$

Closed-form solutions!

- ▪ Moment matching to estimate the hyperparameters

$$q^t(Z_x) : \begin{cases} \mu_x^t = \mathbb{E}_{Q(Z_x | d_x^t)}[Z_x] \\ \lambda_x^t = \dfrac{1}{\mathbb{E}_{Q(Z_x | d_x^t)}[Z_x^2] - \mathbb{E}_{Q(Z_x | d_x^t)}[Z_x]^2} \end{cases}$$

$$q^t(\boldsymbol{\omega}_x) : \begin{cases} \alpha_{i,x}^t = \mathbb{E}_{Q(\omega_x^i | d_x^t)}[\omega_i] \cdot \alpha_{o,x}^t, \ \ i = 1,2,3 \\ \alpha_{o,x}^t = \dfrac{\sum_{i=1}^3 \mathbb{E}_{Q(\omega_x^i | d_x^t)}[\omega_x^i] - \mathbb{E}_{Q(\omega_x^i | d_x^t)}[(\omega_x^i)^2]}{\sum_{i=1}^3 \mathbb{E}_{Q(\omega_x^i | d_x^t)}[(\omega_x^i)^2] - \mathbb{E}_{Q(\omega_x^i | d_x^t)}[\omega_x^i]^2} \end{cases}$$

ICIP, Oct. 27-30, 2014, Paris, France
